

Lubrication

During production the CASAR Special Wire Ropes receive intensive lubrication. This in-process treatment will provide the rope with ample protection against corrosion and is meant to reduce the friction between the elements which make up the rope as well as the friction between rope and sheaves or drums.

At CASAR lubrication takes place during the production of both the strands and the ropes.

This lubricant, however, only lasts for a limited time and should be re-

applied periodically. The wire rope has to be

relubricated (Relubrication).
